Capture NX 2: Lesson 10

Batch Processing enables you to apply a collection of settings to multiple images taken under the same conditions. Here's how it works: if you want to apply an adjustment to a bunch of images, instead of having to open each image individually and make the adjustments, you can make the adjustments on one image, save the steps and apply them to the rest of your images. It's a real time-saver!

In this video, you'll learn how to batch process a group of images and save the processed files.
